Easy2edit

Manual

Version 1.0.0, build 70

31 October 2026

Contents

1. Introduction 3

2. Getting started 6

3. Pages, menu and edit mode 9

4. Importing a website (Site import) 12

5. Media, theme, languages and branding 14

6. Users, roles and security 16

7. Shop, orders, payments, subscriptions and donations 19

8. Community, marketplace, agenda, documents and games 21

9. SEO, FAQ and statistics 23

10. AI and AI credit 25

11. Plugins, backups, licence and deployment 28

1. Introduction

Welcome to Easy2edit, a simple, modular management system (CMS) for building and running portals, websites, webshops and communities. Easy2edit is built on a Django (REST) backend with a Next.js frontend, which keeps the system fast, flexible and easy to extend.

Instead of starting from scratch, you build a website from blocks and switch modules and plugins on or off depending on what your site needs. This means you only use the functionality that is relevant to you, while keeping the option to grow and add more later.

Who Uses Easy2edit

Easy2edit distinguishes three kinds of people who work with or on the system:

- Users: visitors who have created an account. They use the site, but do not manage it.
- Admins: people who manage parts of the site. What an admin can see and do depends on the roles assigned to them.
- Superadmins: the owner or reseller of the installation. A superadmin has access to everything, including system settings, modules, plugins, prices and the licence.

This structure allows a website owner to safely share management tasks with other people, without giving them full control over the entire system.

The Dashboard

Once logged in, you work from the dashboard. The dashboard is organised into three areas:

- Dashboard: your own profile, your notifications and your own AI credit.
- Admin: the management area, where admins handle the day to day running of the site.
- Super admin: the system area, reserved for superadmins, where system-wide settings are controlled.

Depending on your role, you may only see the Dashboard area, or you may also see Admin and Super admin.

Modules and Plugins

Easy2edit is modular by design. Two building blocks make this possible:

- Modules: parts of the system that can be switched on or off. Modules are managed under Super admin > Modules.
- Plugins: signed extension packages that bring their own pages and modules to the system. Plugins are managed under Admin > Plugins.

By combining modules and plugins, you can shape Easy2edit into exactly the kind of platform you need, whether that is a simple website, a webshop, or a community platform, without carrying the weight of features you do not use.

Standard Installations

To make getting started easier, Easy2edit offers standard installations. A standard installation sets up the modules, plugins and theme for a specific type of website with a single click. Available types include:

- Standard website

- Web shop
- Company website
- Business network
- Intranet
- Dating platform
- Sports club
- Foundation
- Marketplace
- Game hall

Each standard installation is shown as a small tile with a settings pop-up. This tile is:

- Visible in the admin area.
- Offered automatically at the time of first installation.

From the settings pop-up, you can configure:

- AI credit settings
- Modules
- Demo data

This makes it possible to launch a working website quickly, and then fine-tune it afterwards by adjusting modules, plugins and settings to fit your exact needs.

The Header

At the top of the screen, the header gives you quick access to a few general controls that are available throughout the system:

- Language switcher: change the display language of the interface.
- Edit-mode switch (pencil icon): turn edit mode on or off, so you can make changes directly on the site.
- Light/dark mode: switch between a light or dark appearance for the interface.
- User menu: access your account options.

These header controls stay available no matter where you are in Easy2edit, so you always have quick access to language, editing, display mode and your account.

Getting Started

A practical way to get familiar with Easy2edit is to follow these steps:

1. Log in and take a look at your Dashboard area to see your profile, notifications and AI credit.
2. If you have admin or superadmin rights, open the Admin area to see which management options are available to you.
3. If you are a superadmin, visit Super admin > Modules to see which modules are currently active.
4. Check Admin > Plugins to see which plugins are installed and what pages or modules they add.

5 If you are setting up a new site, look for the standard installation tiles and use the settings pop-up to choose AI credit settings, modules and demo data for your type of website.

6 Use the header to switch language, toggle edit mode, switch between light and dark mode, and access your user menu.

With these basics in place, you are ready to explore the rest of this manual, which will walk you through each area of Easy2edit in more detail.

2. Getting started

First login

The first time you log in, use the superadmin account. A welcome pop-up will appear that explains the AI credit included with your installation. From this pop-up, the superadmin can also put the AI credit settings in place. Full details on managing AI credit and usage are covered in the AI chapter.

Setting up the basics

Before building your site, take a few minutes to configure the essentials.

1. Go to Admin > System to set the site name, company data, contact data and addresses.
2. Choose a standard installation from the Super admin overview or at Admin > Standard installations. This gives you a ready-made starting point instead of building everything from scratch.
3. Pick a theme and upload your logos at Admin > Theme and Admin > Logos & images.
4. Select the languages your site will support at Admin > Languages.
5. Create your users and define roles at Admin > Users and Roles.

Once these basics are in place, you are ready to explore the modules that make up the rest of the system.

Understanding the modules

Easy2edit is built from modules. Each module adds a specific set of features, and you can switch most of them on or off depending on what your site needs. Below is an overview grouped by purpose, so you know where to look for each feature later in this manual.

Content and pages

- Pages and menu: overview of pages, the header menu, and your own pages and links.
- Edit mode: edit texts, rich formatting and images directly on the website using a switch in the header.
- Media library: manage all images and videos, stored locally or on S3.
- Site import: import another website (address, folder or ZIP), including theme, pages, homepage, icons and images. Can be removed again together with everything it brought in.
- System objects: parts of other modules, such as donation buttons or subscription blocks, that you can place on a page in edit mode. This module gives you an overview and lets you turn each object on or off.
- Logos and branding: logo, favicon, app icon and homepage photos.
- Design: colours, fonts, themes and popup style. Switched off means the standard style is used.
- Languages: multilingual support and language selection. Switched off means only the standard language is available.

Visibility and trust

- SEO: search engines, bots and AI agents, covering robots.txt, sitemap, llms.txt, page titles, descriptions and structured data.

- Easy2edit help: built-in explanation of the system itself, shown only in the dashboard, in all languages. Users only see help for the parts they have rights to.
- FAQ: your own frequently asked questions, which you create and translate yourself, shown on the /faq page. Add this page to the menu under Pages.
- Privacy and cookie pages: the public /privacy and /cookies pages, linked from the footer.

Commerce

- Subscriptions: subscriptions that grant access to the site, pages, content, chat, video, likes or services, either one-off or recurring, with an order per period.
- Donations: one-off gifts to the site owners with an amount chosen using a slider. Works without the webshop but requires the Orders and Payments plugins.
- Orders: order management, VAT and order status for the webshop, subscriptions and donations. The Orders plugin itself is switched on or off under Plugins; here you only set who is allowed access.
- Payments: online payment for orders, subscriptions and donations. The Payments plugin (which needs Orders) is switched on or off under Plugins; here you only set who is allowed access.

Community and interaction

- Profiles and blocking: a personal profile page with multiple photos, visibility per language and group, a member search and the ability to block other users.
- Discover: find and meet other users in a dating-site style, with filters, recommendations, likes, matches, favourites and visitors.
- Messages: a messaging system between users, including an inbox.
- Chat: chat in a popup or full screen, either through the portal or directly via WebRTC, including photos, video and video chat.
- Direct connect: a direct WebRTC connection between two people using a code, link or QR code, even without an account, including chat, photos, video and video chat. Available on the /directconnect and /direct pages.

Compliance and safety

- Geo control: block or allow the site per country using IP checks.
- Age gate: an 18+ popup for visitors.
- Gambling popup: an age and warning popup for gambling content.
- Cookies: cookie banner, preferences and cookie policy popup.
- Word filter: block forbidden words in texts, names and captions.

Accounts and security

- Registration: lets visitors create their own account, with email confirmation and two-step verification according to your security rules.
- Two-step verification: login confirmation using a code sent by email or SMS.
- Users: create, block and delete accounts, including a photo and public profile for the website.
- Roles: roles and permissions. Switched off means only superadmins have rights.
- Dashboard and profile: login, dashboard and the user's own profile.

- General security: login lockout, session duration, password rules and security headers.

System and technical

- API keys: connections with external systems such as Claude, Stripe, S3 and Postmark. Switched off means all connections are inactive.
- Communication: the email addresses, reply addresses and mobile numbers the system is allowed to use.
- Plugins: upload separate programs that work together with the system and can use all its functions. Available to superadmins only, since plugins run as trusted code.
- Notifications: alerts for users across the system and all modules, including a notification bell and overview page, administrator messages, and per-user choices for which notifications and emails to receive.
- Sandbox: a test environment that simulates email, SMS, payments and other external services without calling the real APIs.
- Basic data: the name and addresses of the website (frontend and API), contact details, plus a checklist and ready-made settings for deployment.
- Folder structure: where files are stored (users, website, other), whether locally or on S3, and per-user encryption.
- Statistics: charts and figures for the whole website, covering visitors, SEO, bots and AI calls, with a separate tab per module and plugin.
- Backups: daily, weekly or monthly backups of pages, menus, texts, images, theme and module and plugin settings, with options to restore or download. Easy2edit's own default data is not included.
- AI: all AI usage in the system through Claude, showing who asked what, where, how many tokens were used and what it cost, including a margin per token. This module is always active once an AI connection is set up, and the superadmin sees the AI dashboard.
- Module management: the page where you manage all of the above, available to superadmins only.

Most modules can be switched on or off to match the needs of your site, and later chapters explain each one in more detail.

3. Pages, menu and edit mode

This chapter explains how pages and the menu are organised in Easy2edit, and how to build and edit page content using edit mode, rows, cells and items.

Pages and menu overview

All pages and menu items are managed from Admin > Pages. Here you will find three kinds of entries:

- System pages: built-in pages such as Home and products.
- Own pages: text pages that live at an address like /p/<key>, which you create and manage yourself.
- Links and menu items: entries that point to other pages, external links or simply act as menu structure.

Page settings

Each page has its own set of settings, which you can adjust individually:

- Names per language. You can enter a name for each language, or use the AI translation option to translate the name automatically into all other languages.
- Address per language, so a page can have a different URL per language.
- Visibility, choosing who may see the page: everybody, logged-in users only, guests only, or specific users or groups.
- Show in the header menu, to include or hide the page from the main navigation.
- Open in new tab, useful for links to external resources.
- Devices, letting you decide if the page is shown on desktop, tablet and/or mobile.
- Page-specific theme, header and footer, in case a page needs a different look than the rest of the site.
- SEO settings per language.
- A background for the page, which can be an image or a video.

Switching on edit mode

To start editing a page, switch on the pencil icon in the header. This activates edit mode, which overlays the page with editing tools while keeping the page looking as it will to visitors.

Rows, cells and items

Pages in Easy2edit are built from rows, which act as horizontal blocks stacked on the page. Each row can be split into cells, with one to four columns per row. Inside each cell you place items, which are the actual pieces of content.

Available items include:

- Heading
- Text (rich text)
- Image
- Button

- Spacer
- Line
- System objects
- Ready-made parts: contact data, social media, map, video, quote, figures, logo, opening hours
- HTML / CSS code

Row settings

Click the gear icon in the corner of a row to open its settings. From here you can control:

- Background colour, image or video
- Overlay
- Padding
- Width: column, wide, or full screen
- Hero height
- Text colour
- Rounded corners
- Space above the row

Cell settings

Each cell within a row has its own settings, including:

- Width
- Alignment
- Card style: background, border, radius and shadow

Text and button settings

Text items can be styled individually with:

- Style, size, colour and font
- Padding
- Background, shown as a label or pill

Button items can be configured with:

- Label per language
- Link
- Style: primary, outline or ghost
- Colours
- Size
- Icon

The HTML / CSS code part

For advanced customisation, you can add the item HTML / CSS code. This opens a large pop-up with three tabs: Visual, HTML and CSS.

1. In the Visual tab, click directly into the text and type what you want. This works on a what-you-see-is-what-you-get basis, with a toolbar offering bold, italic, underline, list, link and clear formatting, plus a switch between a light and dark background.
2. In the HTML tab, you can edit the underlying markup directly.
3. In the CSS tab, you can add your own styling.

The code you enter runs in a sandboxed frame, meaning it has no rights on the rest of the site, keeping your website safe from unintended effects.

System objects

System objects are special items such as donation buttons, subscriptions, media views, plugin parts and, for superadmins, AI dashboard blocks. Before they can be used, the relevant module must be switched on in Admin > System objects. Once enabled, you can place them on a page in edit mode via + Add > System objects.

Editing pages imported from HTML

If a page was taken over directly from an HTML file during site import, it behaves slightly differently in edit mode. Every text and button on such a page shows its own pencil icon. Clicking this pencil opens an editor that displays the text exactly as it appears on the page, with formatting options for bold, italic, underline and link, and for buttons, a field for the link address. Once you click Save, your changes are written directly into the page.

4. Importing a website (Site import)

Site import lets you bring an existing website into Easy2edit without starting from scratch. You point the system at your old site, an AI assistant reads it and proposes a theme, pages and content, and nothing is created until you approve the proposal.

Where to find it

Go to Admin > Imported. Before you have imported anything, this button is labelled 'Site import'. Once a site has been imported, the same menu item is renamed 'Imported' and becomes the place where you manage existing imports.

Starting an import

You can start an import in several ways:

- Drop one or more HTML files onto the import screen
- Give a web address
- Point to a folder
- Upload a ZIP file

Once the files are provided, the AI analyses them and prepares a proposal covering:

- A theme: colours, fonts, corner roundings and content width
- Pages and their content
- Icons and images, which are placed in the media library tagged 'import'
- Any modules that are needed to support the content, for example the FAQ module for a list of questions

Nothing is built at this stage. You can review the full proposal before deciding whether to continue.

Approving the proposal

When you approve the proposal, the theme is installed and put into use straight away. After that, you move on to the 'Apply' step, which opens a pop-up or panel with several tabs: Pages, Links, Buttons, Header, Footer and Theme.

Applying pages

On the Pages tab you see two columns: pages from the imported file on the left, and the pages of your own website on the right. Drag a file page onto an existing page (for example Home) to link them, or leave a file page unlinked so it becomes its own new page.

For each page you choose how it should be built:

- Exact: the page looks exactly like the original HTML file. Texts and buttons can still be edited later with the pencil in edit mode.
- Editable: the AI rebuilds the page using the blocks of the page builder. Cards, label pills, band colours, rows and the hero section are recreated as blocks. Anything the blocks cannot reproduce, such as a progress bar, check lists or preview cards, is placed in an 'HTML / CSS code' block instead.

You can also give the AI an optional instruction for how to build the page, for example 'make the headings bigger'.

For pages that already have content, choose what should happen to it:

- Clear the existing content first
- Replace only the blocks that came from this import
- Add the imported content below what is already there

You can also choose whether the pages should be translated into your site's other languages.

Links, buttons, header and footer

On the Links and Buttons tabs, drag and drop the links and buttons found in the imported file onto the matching pages or parts of your own website, so navigation keeps working correctly.

On the Header tab, you can switch the header of your system to the header from the imported file, which brings in a bigger menu together with the links and buttons it contained.

On the Footer tab, you can choose to show the footer from the import underneath your pages.

Theme tab

The Theme tab lets you fine-tune the proposed theme: adjust colours, the default light or dark mode, the content width and the roundings used throughout the design.

Progress and completion

While the import is being applied, a pop-up shows progress as a percentage. When it finishes, a 'Go to page' button appears so you can view the result directly.

The original HTML file is always kept, so you can run 'Apply' again later with a new instruction if you want to adjust the outcome.

Managing imports afterwards

Each import is listed with a status of Pending or Active. The list of pages belonging to an import shows, for each page: its name, whether it appears in the menu, whether it is visible, and which view (Exact or Editable) was used.

In Admin > Pages, open the settings of an imported page and you will find an 'Import' tab. Here you can give the AI a new instruction and use a button to rebuild just that single page from the original file, without affecting the rest of the import.

Removing an import

If you remove an import, the system puts back the theme and content that existed on the pages before the import, or advises you to reinstall it through the superadmin if that is not possible. Everything the import created is then removed.

The standard home page, with its default logo, title, text and photos, is always left empty on a new installation and is overwritten by an import. This ensures the default home page content never shows up behind an imported page.

5. Media, theme, languages and branding

This chapter covers the settings that control how your website looks and which languages it speaks. These tools work together: the media library supplies the pictures and videos, the theme controls colours and layout, the logos and images section handles your brand identity, and the languages module decides what visitors see in their own language.

Media library

The media library is where you manage all images and videos used on your website, whether they are stored locally or on S3. Every file can be tagged, which makes it easier to find the right picture later when you are building a page.

Because the library is connected to every part of the system, you can pick a picture from it whenever a pop-up window asks you to choose an image. This means you never have to upload the same file twice. Once a picture is in the library, it is available everywhere.

Practical tips for managing your media:

- Use clear, consistent tags so you and your colleagues can find files quickly.
- Check whether your files are stored locally or on S3 if you are troubleshooting loading speed or storage limits.
- Remove unused files occasionally to keep the library organised.

Theme

Go to Admin > Theme to control the visual style of your website. If the theme module is switched off, the website uses its standard style. Switching it on gives you access to a wide range of design options.

In the theme settings you can adjust:

- Colours for both light mode and dark mode
- Fonts used throughout the site
- Roundings of buttons, cards and other elements
- Content width, to control how wide or narrow the main content area appears
- Header layout, including an editorial layout with a side menu
- Pop-up style, for how dialog windows and overlays appear

To make styling even easier, the theme module includes ready-made theme packs. These are complete style combinations that you can switch to with a single click, giving your website an instant new look without adjusting every setting by hand.

If you want to reuse a theme on another website, or keep a backup of your current design, you can export your theme settings. Importing a theme file lets you apply those same settings elsewhere.

Steps to change your theme:

1. Go to Admin > Theme.
2. Browse the available theme packs, or adjust individual settings such as colours, fonts and roundings.
3. Preview your changes before saving, if a preview option is available.

4 Save your settings to apply them to the live website.

5 Optionally, export the theme so you have a backup or can reuse it elsewhere.

Logos and images (branding)

This section controls the core visual identity of your website:

- Logo, with separate versions for light and dark mode
- Favicon, the small icon shown in browser tabs
- App icon, used when visitors save your website as an app on their device
- Photos displayed on the home page

Keeping these elements up to date ensures your brand looks consistent and professional across browsers, devices and app shortcuts. When you update your logo or favicon, check both the light and dark versions so your branding looks correct no matter which mode a visitor's device is using.

Languages

The languages module controls whether your website is available in more than one language. If this module is switched off, the website only shows the default language.

When switched on, you can:

- Choose which languages your website offers to visitors
- Set the default language that visitors see first
- Translate texts using the built-in AI translation tool

This makes it possible to reach a wider audience without manually writing every page in multiple languages. The AI translation feature speeds up the process, though it is still a good idea to review translated texts for accuracy and tone before publishing.

It is worth noting that the system interface itself, the menus, buttons and labels that administrators and editors see, is already available in 44 languages. This is separate from the content languages you choose for your visitors, but it means your editorial team can work in the language they are most comfortable with.

Steps to set up multiple languages:

1 Go to the languages settings in the admin area.

2 Switch on the languages module if it is not already active.

3 Select the languages you want to offer on your website.

4 Set your default language.

5 Use the AI translation tool to translate existing content, then review the results.

Bringing it together

Media, theme, branding and languages each play a distinct role, but they shape the same visitor experience. A well-tagged media library makes design work faster, a well-chosen theme pack gives your site a professional appearance in minutes, consistent logos and icons reinforce your brand, and the right language settings make your content accessible to a wider audience. Reviewing these settings together, rather than in isolation, helps keep your website looking polished and functioning smoothly.

6. Users, roles and security

Easy2edit gives you several layers of control over who can use your website, what they are allowed to do inside the admin area, and how visitors are protected on the front end. This chapter explains user accounts, roles and rights, and the security modules that keep your site compliant and safe.

Users

Go to Admin > Users to manage the people who can log in to your site. For each user you can:

- Create a new account
- Add a profile photo
- Block an account temporarily
- Delete an account

A user can also have a public profile that is shown on the website itself, for example an author page or team member page, in addition to their admin access.

User groups

User groups let you organise users into collections that share the same roles and the same access to modules. Instead of setting rights for every person one by one, you assign a group to a role and give the group access to the modules it needs. This is useful for teams such as editors, moderators or support staff.

Roles and rights

Roles (Admin > Roles) determine what a user or group is allowed to see and do inside the admin area. A role is a set of rights, for example:

- Content manager
- Moderator
- View AI use of users

Rights open up specific parts of the admin area. A user only sees the sections that match the rights included in their role.

Superadmins always have every right, regardless of the roles module settings.

If the Roles module is switched off, only superadmins have any rights in the system. Turning the module on allows you to create and assign roles to other users and groups.

Steps to set up a role:

1. Go to Admin > Roles.
2. Create a new role and give it a clear name, such as "Moderator".
3. Select the rights this role should include.
4. Assign the role to a user or a user group.

Modules per user or group

Besides roles, access to individual modules can also be granted directly to a specific user or group. This is managed under Super admin > Modules, using the person icon next to a module. This allows fine-tuned access, for example giving one person access to a module without changing their overall role.

Dashboard and profile

Once logged in, users land on their dashboard. From there they can manage their own profile, including their personal details and photo. The dashboard is the starting point for everyday work in the admin area, showing the sections the user has rights to.

General security

The Algemene beveiliging module covers the core security settings for your admin environment:

- Login lock, to stop repeated failed login attempts
- Session duration, controlling how long a user stays logged in
- Password rules, to enforce stronger passwords
- Security headers, to help protect the site at a technical level
- Two-step verification, for an extra login check

These settings apply to everyone logging in to the admin area and are an important baseline for keeping accounts safe.

Country control

The Landcontrole module lets you block or allow access to your website based on the visitor's country, using IP-based checks. This is useful if your content or services should only be available in certain regions.

Age and gambling checks

Two modules help you meet legal requirements for age-sensitive content:

- Leeftijdscontrole shows an 18+ popup to visitors before they can view the site.
- Gokken-popup shows a combined age and warning popup specifically for gambling-related content.

Enable the module that matches your situation; if your site involves gambling content, use the gambling popup rather than the general age check.

Cookies

The Cookies module manages the cookie banner shown to visitors, lets them set their preferences, and provides a cookie policy popup. This helps your site meet cookie consent requirements.

Word filter

The Woordfilter module lets you define a list of forbidden words. These words are automatically filtered out of texts, names and captions submitted or displayed on the site, helping keep user-generated content appropriate.

Putting it together

A typical setup combines these tools as layers:

1. Use Users and User groups to organise who can log in.
2. Use Roles to control what each person or group can do in the admin area.
3. Use per-module access under Super admin > Modules for any exceptions.
4. Use Algemene beveiliging to protect the login process itself.
5. Enable Landcontrole, Leeftijdscontrole or Gokken-popup, Cookies and Woordfilter as needed for your audience and legal requirements.

Together, these modules let you manage internal access carefully while also protecting and informing your visitors on the front end.

7. Shop, orders, payments, subscriptions and donations

Easy2edit lets you sell products, collect donations and run subscriptions through a set of linked plugins. Because these features depend on each other, it helps to understand how the pieces fit together before you start setting up your shop or payment flows.

How the plugins work together

Several plugins share the work of selling things on your site:

- Webshop handles products, product groups, variants and the shop pages themselves (products, shopping cart, checkout).
- Orders manages everything related to orders across the whole site, whether they come from the webshop, subscriptions or donations.
- Financieel (Finance) takes care of payment methods, VAT, shipping options and document layout.
- Abonnementen (Subscriptions) manages subscription plans and donation actions.

These plugins depend on each other. The Webshop plugin needs Orders and Financieel to function, since it cannot process payments or manage orders on its own. The Orders plugin can work independently if you only accept payment by invoice, but it needs Financieel if you want to accept online payments. Financieel itself is required by Orders, Webshop and Abonnementen, since it is where payment methods, VAT rates and document layouts are configured. Abonnementen needs Orders to create a periodic order for each subscription payment or donation.

In practice, this means that if you want to run a webshop with online payments, you will need to activate Webshop, Orders and Financieel together. If you only want to sell subscriptions or collect donations, you need Abonnementen plus Orders, and Financieel if you want online payment.

Setting up the webshop

The Webshop plugin lets you build a catalogue of products and product groups. Each product can have variants, such as colour or size, and each variant can have its own price. You can also set up staffelprijzen (quantity-based pricing), so customers pay less per unit when they order more.

Webshop comes with demo content that includes the shop pages on your website: the product overview, the shopping cart and the checkout page. You can use this as a starting point and adjust it to match your own products and branding.

To configure shipping and discounts:

1. Go to Admin > Webshop (or the relevant shop settings area).
2. Set up your shipping methods, including any conditions or costs per method.
3. Create discount codes if you want to offer promotional pricing.
4. Add your products and product groups, including variants and staffelprijzen where needed.

Because Webshop depends on Orders and Financieel, make sure both of these plugins are active and configured before customers start placing orders.

Managing orders

The Orders plugin is the central place for order management across your entire site. It handles orders from the webshop, from subscriptions and from donations, all in one overview.

Here you can:

- Review and update the order status of each order.
- Configure VAT settings for your orders.
- Customise the confirmation email that customers receive after ordering.

Orders can work on its own if you only want to let customers pay by invoice, without any online payment integration. If you want to offer online payment methods, you will need to add the Financieel plugin as well.

Payments and financial settings

The Financieel plugin brings together everything related to money on your site. This includes:

- Payment methods and payment terms, with ready-made links to Stripe and Mollie.
- VAT rates, with a standard high and low rate that you link to your products.
- Shipping options.
- The layout of your financial documents: invoices, quotes, packing slips and return slips.

Payments themselves are processed through Stripe or Mollie. Before going live, you can use the sandbox mode to simulate payments, which lets you test the full checkout flow without processing real transactions.

Orders, Webshop and Abonnementen all depend on Financieel, so this plugin needs to be set up correctly as the foundation for any paid feature on your site.

Subscriptions and donations

The Abonnementen plugin lets you create subscription plans that give customers access to specific parts of your site, such as pages, content, chat, video, likes or services. Subscriptions can be set up as a one-time payment or as a recurring plan, where an order is automatically created for each period.

This plugin also supports donation actions. Instead of a fixed price, visitors choose an amount themselves using a slider, which you configure with a minimum and maximum value.

Actions within Abonnementen determine what content or access is free and what requires payment, giving you control over which parts of your site are open to everyone and which are reserved for paying subscribers or supporters.

Since Abonnementen relies on Orders to generate an order for each period or donation, make sure Orders is active and properly configured. If you want to accept online payments for subscriptions or donations, Financieel is required as well.

8. Community, marketplace, agenda, documents and games

Easy2edit offers a set of plugins that turn your site into a social platform where members can build profiles, connect, trade, plan appointments, share documents and play games. This chapter explains what each part does and how the pieces work together.

Community

The Community plugin brings together everything needed for a community or dating site. Members get their own profile pages with photos, and they can use the member finder to discover other users or block someone they do not want contact with.

Community includes several building blocks:

- Searching and matching: filters, recommendations, liking profiles, matches, favorites and visitors, similar to a dating site.
- Messages: a private messaging system between users, like an inbox.
- Chat: available in a popup or full screen, through the portal or directly between two devices using WebRTC, including photos, videos and video chat.
- Direct connection: a direct WebRTC link between two people using a code, a link or a QR code. This even works without an account, through the pages /directconnect and /direct, and supports chat, photos, videos and video chat.

Profiles can use profile themes, custom profile fields and "available for" options to describe what a member is looking for. When parts of the Community require a subscription or a donation, the plugin works together with the Subscriptions plugin to manage access.

Profile themes

Profile themes let you tailor the Community to a specific type of site. Ready-made packages are included for Sporters, Dating, Business and Webshop. You can install or remove these packages, or create your own theme with custom fields, visibility settings and search filters.

As superadmin, you decide which themes administrators and users are allowed to choose. Themes can be exported and imported as JSON files, which makes it easy to reuse a theme on another site or share it with others.

Marketplace

The Marketplace lets members offer products, services or other items for sale. Each listing can have its own theme and images, and supports three ways of selling:

- A fixed price.
- Bidding, starting from a minimum price.
- A booking, for example an appointment or registration for an event.

All bids placed on a listing are visible to all members, keeping the process transparent.

Agenda

The Agenda plugin provides a calendar for both individual users and groups. Members can:

- Keep their own personal appointments.
- Make appointments with other members, including sending invitations, confirming, or proposing a different time.
- Join group appointments.
- See events created by administrators, which can be placed on pages as a system object.

The Agenda supports reminders and notifications, and shows a tile on the dashboard so members never miss an upcoming appointment.

Document management

Document management allows members and administrators to upload documents in a folder structure. Each document can be tagged, kept in multiple versions, and protected with rights per user or group.

Files can be stored on the server or on S3, and can be encrypted for extra security. To show documents on your pages, use the available blocks designed for this purpose.

Games

The Spelletjeshal (game hall) gives members a place to play. Each game is its own package, delivered as a folder or zip file containing a game.json file, placed in the games folder of this plugin. A game package includes:

- Configuration options for administrators.
- Settings that each member can adjust individually.

Games run in a sandboxed environment and automatically save scores and progress. Leaderboards let members compare results, and a sample game is included so you can see how a game package is structured.

Age, country and gambling checks

Some communities need extra legal safeguards. Easy2edit supports:

- Age verification (18+).
- Country checks.
- A gambling popup (24+).

These checks only apply to the target groups where they are required or desired. The settings for all three are found under Admin > Security, but note that the popups and country check only work when this plugin is switched on.

Working together

Many of these features are designed to reinforce each other. A member might set up a profile using a Dating theme, get matched with another member through the discover feature, exchange messages or chat, arrange a meeting through the Agenda, and later sell an item through the Marketplace, all within the same site. Documents can support any of these activities, for example by sharing files privately with a group, while the games hall adds a lighter, social activity for members to enjoy together.

9. SEO, FAQ and statistics

SEO

Easy2edit helps search engines, bots and AI agents understand your website correctly, so that your pages can be found and interpreted properly.

The SEO tools in Easy2edit take care of:

- robots.txt, which tells search engines and other automated visitors which parts of your site they may or may not access
- a sitemap, which lists your pages so search engines can find and index them efficiently
- llms.txt, a file aimed at AI agents and language models, describing your site for them in a format they can use
- page titles and descriptions, which appear in search results and help visitors decide whether to click through to your page
- structured data, which adds extra information to your pages so that search engines and AI agents can understand what the content is about, such as articles, products or organisation details

Together, these elements make your website easier to find, easier to understand, and better prepared for both traditional search engines and newer AI-based tools that read and summarise web content.

You do not need to set up these files manually. Easy2edit generates and manages them for you, and keeps them up to date as your site content changes.

FAQ

The FAQ module lets you publish your own frequently asked questions and answers on your website, on the page /faq.

You write and maintain the questions and answers yourself, and you can translate them into all the languages your website supports. This makes the FAQ module a simple way to help visitors find answers without having to contact you directly.

To make the FAQ page accessible to visitors, add it to your site menu:

1. Go to Admin > Pagina's.
2. Find the FAQ page.
3. Add it to the menu so visitors can navigate to it directly.

If your website was imported from an existing site, any questions and answers found during the import are automatically placed into this FAQ module, so you do not lose existing content and can continue editing it in the same place.

Statistics

The statistics section gives you an overview of how your website is performing, combining charts and numbers in one place.

Here you can see information about:

- visitors to your website
- SEO performance

- bot activity
- AI calls, meaning requests made to your site by AI agents and similar automated tools

In addition to these general figures, each module and plugin that is installed and active on your site gets its own section within the statistics area. Modules and plugins report their own figures here, so you get a complete picture of how each part of your website is being used, displayed as widgets with charts.

Some things to keep in mind:

- Statistics are only collected for plugins and modules that are switched on. If a plugin is turned off, nothing is counted for it, and no figures will appear in its section.
- Because each module and plugin manages its own statistics, the exact figures shown can vary depending on which plugins you use and what they track.

This setup means the statistics area grows together with your website. As you add more modules and plugins, you automatically get more insight into how your site is being used, without needing to configure separate tracking tools for each one.

10. AI and AI credit

Easy2edit uses artificial intelligence (Claude, by Anthropic) throughout the system to translate content, write page texts, import websites, research prices and more. Every single call to the AI is logged in detail: who made the request (a user, admin, superadmin or the system itself), from which part of the system it came, which model was used, how many tokens went in and out, how long it took, whether it succeeded, and what it cost. This chapter explains how AI access works, how costs are calculated, and how AI credit is managed for users and admins.

The AI module and AI links

AI is a core module. It switches on automatically as soon as an AI link (an API key) is installed and enabled under Admin > API keys.

An AI link can be marked as a Superadmin link. When this is done, only superadmins can see or change that link. This is typically used for the Easy2edit AI link and the Stripe link of the reseller.

AI calls made by users and admins always run through an Easy2edit link belonging to the superadmin, whenever one is available.

The Super admin AI dashboard

Superadmins manage and monitor all AI activity from Super admin > AI. The dashboard has the following tabs:

- Overview: key figures, cost over time per group, share of cost per group, and the last calls made.
- Where: shows where AI is used most, what costs the most, which tasks and models are involved, and the busiest hours and weekdays.
- Users: heavy users and highest costs, with a table per user and a PDF button per row.
- Costs: cost breakdowns per month or week, per group and per user.
- Credit: management of AI credit.
- Blocks: AI dashboard elements that can be placed on pages.
- Settings: pricing, margins and currency settings.

Filters are available for period, month (the current month plus the twelve before it) and group. The PDF button generates a summary; choosing 'Detailed' produces a complete list of every call, including tokens in and out, duration and costs.

Costs, prices and margins

Superadmins set purchase prices per million tokens per model, organised in tabs for Claude, OpenAI and Gemini, showing only the models currently active in the API. The 'Refresh models' button also looks up current prices directly from the AI.

Purchase prices are set in the purchase currency (for example USD), while sale prices are set in the selling currency (for example EUR), using an exchange rate that can be updated with a button that consults the AI.

Three separate margins are configured, each in percent and set separately for tokens in and tokens out:

- Users

- Admins
- Reseller/superadmin

A switch determines whether AI use by superadmins and the system is also charged to the customer. When this is on, such use is booked to a group named after the website, using the reseller margin. When it is off, this use is a cost to the reseller with no margin applied, and it is shown separately.

Prices, exchange rate and margins are stored with each individual call, so any changes to settings only affect new calls going forward.

Only superadmins can change these AI settings.

AI credit for users and admins

By default, users and admins must purchase AI credit before they can use AI features (this requirement is on by default). Superadmins and the system itself never need credit.

Before every AI call, the system estimates its cost and checks it against the available credit. If there is not enough credit, nothing is sent, and a message tells the user what is needed.

After the call completes, the actual cost is deducted from the credit balance.

When a user's credit runs low, a pop-up appears with a slider. The slider offers a minimum top-up of 25, 50 or 100, based on that user's AI use over the last 30 days, along with a suggested amount.

Payment always goes through Stripe using an Easy2edit link belonging to the superadmin, never the website's own shop Stripe account. Credit is added once payment is confirmed, which happens when the customer returns from payment and again when the AI screen is opened.

Superadmins set the available top-up amounts and can manually add or deduct credit per user at Super admin > AI > Credit.

Every admin sees a welcome pop-up at their first login, explaining how AI credit works.

Each standard installation includes an AI tab showing:

- Whether AI belongs to this installation
- Whether credit is required
- The smallest and biggest top-up amount

Admin view of AI use

Admins can review AI use at Admin > AI. This view shows the AI use of users and admins, but does not include purchase prices, margins or reseller costs.

The Admin start page also shows a block called 'AI use', displaying the admin's own credit balance, a table per user, and a PDF export per user (this report never includes purchase prices).

To see this information, an admin needs the right 'View AI use of users', assigned through Roles.

Admins with their own AI and Stripe link

An admin who has configured their own AI link (Anthropic) and their own Stripe link, with neither marked as a superadmin link, can switch on their own credit system for their users at Admin > AI > Credit for users.

In this case:

- The admin's users use the admin's own AI link.
- Payments go through the admin's own Stripe account.
- The margin earned belongs to the admin.

The admin sets the credit rules, top-up amounts and margin, and can add credit per user manually.

AI blocks on pages

Parts of the AI dashboard, such as key figures, costs over time, use per group, where AI is used, heavy users, highest costs, models and busy hours, can be switched on as system objects at Super admin > AI > Blocks. These blocks can then be placed on a page in edit mode. Only superadmins can see the figures in these blocks.

11. Plugins, backups, licence and deployment

This chapter covers the parts of Easy2edit that keep your website extendable, safe and properly licensed: plugins that add functionality, backups that protect your work, the licence that covers what you use, and the deployment setup that keeps everything running.

SEO: how your site is found

Easy2edit takes care of the technical details that search engines, bots and AI agents look for. This includes a robots.txt file, a sitemap, an llms.txt file for AI agents, page titles, descriptions and structured data. You do not need to configure these by hand; the system generates and maintains them as your pages, modules and plugins change.

Importing a site

If you are migrating from another website, Easy2edit can read it in for you. You can point it at an address, a folder, a ZIP file or a single html file. The import brings across the theme, pages, start page, icons and images.

When you import a single html file, Claude builds the theme, the pages and the content, and switches on whichever modules are needed to support that content. This is a convenient way to bootstrap a new Easy2edit site from an existing static page.

An imported site, along with everything that came with it, can be removed again in one step if you no longer need it.

Statistics

Admin > Statistics shows charts and figures for the whole website: visitors, SEO performance, and calls from bots and AI agents. Each module and plugin that is switched on gets its own tab with its own numbers.

Modules and plugins write their statistics here automatically. If a plugin is switched off, it stops counting and nothing is recorded for it, so the statistics only ever reflect what is actually active on your site.

Plugins

Plugins are managed at Admin > Plugins. Each plugin is a signed package that lives in the /plugins folder, which keeps your installation secure and verifiable.

To work with plugins:

1. Open Admin > Plugins to see what is installed and what is available.
2. Install new plugins from the library (resource/plugins).
3. Switch plugins on or off as needed.
4. Update installed plugins when new versions are available.

A plugin is a self-contained package. It can bring its own pages, its own modules, translations in up to 44 languages, and its own admin screens. This means that once a plugin is switched on, it should feel like a natural part of your site, with menus and settings in the right place and content available in the languages you support.

Backups

Admin > Backups lets you protect your site's content and configuration. Backups can be made per day, week or month, and each backup includes:

- Pages
- Menus
- Texts
- Images
- Theme
- Settings of modules and plugins

From the Backups screen you can restore a backup or download it for safekeeping elsewhere.

The standard installation basis is described in installations.json, which is part of the system itself. For security reasons, secret keys are never stored in this file, so backups and the installation basis never expose sensitive credentials.

Licence

Admin > Licence shows the costs and payment method for your licence, which can be settled through Stripe or by invoice. The price is not fixed: it follows directly from which modules and plugins you have switched on, so you only pay for what you actually use.

Super admin users have access to an additional Prices section with:

- The price list per month, quarter and year
- Quotations that can be generated as PDF
- Marketing tiles
- Sales calculation tools

This gives super admins everything needed to quote, invoice and present pricing to customers.

Deployment

Easy2edit is designed to run in Docker. Separate compose files are provided for development and production environments, so you can run a safe local setup while keeping production configuration distinct.

A typical production deployment also involves a reverse proxy and certificates to handle secure traffic to your site.

When the backend starts, it automatically runs any pending database migrations, so upgrading the system does not require manual database steps.

Every installation displays its version clearly, in the form "Easy2edit version 1.0.0 build X". This version and build number come from one central place, backend/BUILD, so you can always check at a glance which version of Easy2edit is running and confirm it matches what you expect after an update.
